

Problem-Solution Fit Canvas: Implement Client Script and UI Policy

Team ID: SWTID-2026-2511 | Team Leader: Ritika L | Members: Monisha A, Saranya G, Roshini A V, Yashika K | Team Size: 5

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS - Service desk agents / incident analysts who create and update Incident records in ServiceNow. - Incident managers and team leads who need clean, consistent ticket data. - ServiceNow administrators/developers who maintain the Incident form. - Secondary: end users who raise incidents through the form.	6. CUSTOMER CONSTRAINTS CC - Form behaviour must change on the fly, without submitting or reloading the form. - Changes must be client-side (UI Policy / Client Script) and fit change-control, with update sets. - Users have mixed ITSM experience and little time during urgent incidents. - Rules must not over-restrict legitimate cases or slow the form down. - Must work for all roles and devices that open the Incident form.	5. AVAILABLE SOLUTIONS AS - Manual checks and process documents: inconsistent and only catch errors after the fact. - Business Rules / server-side validation: secure, but feedback comes only after save. - Data Policies: enforce rules server-side, but cannot dynamically show/hide fields. - Team-lead reminders and reopening tickets: causes rework and delays. - Default Incident form with no conditions: fast, but allows incomplete or wrong data.	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS J&P - Make key fields mandatory when a condition is met (e.g. Close code and Close notes when State = Resolved; On hold reason when State = On Hold). - Make fields read-only to protect data (e.g. Number, Caller, or Category once an incident is resolved). - Show only relevant fields (e.g. Hold reason only when On Hold) to keep the form uncluttered. - Use Client Scripts (onLoad, onChange, onSubmit) to validate input and guide users instantly. - Reduce incorrect and incomplete data entry.	9. PROBLEM ROOT CAUSE RC - The standard Incident form shows every field all the time and gives no conditional guidance. - Validation happens late (after submit, or in manual quality review) rather than at the moment of entry. - Users are unsure which fields are required for each State, so data ends up incomplete or inconsistent. - Result: rework, weak reporting and SLA analysis, and poor audit quality.	7. BEHAVIOUR BE - Agent opens or creates an incident, fills the visible fields quickly and changes State, Impact or Urgency. - Agents often skip fields that seem optional, then fix them after a reviewer flags the ticket. - Admin defines a UI Policy with conditions (e.g. State is Resolved) and actions (Mandatory / Read-only / Visible). - Admin adds Client Scripts using g_form (setMandatory, setReadOnly, setVisible) and tests on a dev instance. - Admin moves the changes to production via update set.	
Focus on J&P, tap into BE, understand RC				Focus on J&P, tap into BE, understand RC
	3. TRIGGERS TR - Incidents closed without resolution notes or close code. - A data-quality audit or report showing missing or wrong values. - Complaints from managers about rework and SLA reporting errors. - A new process standard, or the user changing State, Impact or Urgency on the form.	10. YOUR SOLUTION SL - A UI Policy on the Incident table whose conditions, when met, set selected fields to Mandatory, Read-only or Visible. - Client Scripts (onLoad / onChange / onSubmit) for dynamic behaviour and instant validation messages. - All of it runs in the browser as the user works, with no form submission. - Fit with the customer: respects the constraints (client-side, no reload, update-set friendly), solves the problem (incomplete and incorrect data) and matches behaviour (agents work directly in the form). - Outcome: consistent data entry, fewer incorrect records, better user experience.	8.1 ONLINE (8. CHANNELS of BEHAVIOUR) CH - Filling in and updating the Incident form in the ServiceNow web UI or mobile app. - Changing State, Category, Impact and Urgency and reading the on-screen field messages. - Searching the knowledge base for how to complete incidents. - Admins: creating UI Policies and Client Scripts in System UI / Studio and testing on the dev instance. - Reviewing dashboards and reports on incident data quality.	
Identify strong TR & EM	4. EMOTIONS: BEFORE / AFTER EM - Before: rushed, unsure what is required, frustrated by rework and corrections. - After: guided, confident and in control, because the form tells them what to fill in. - Admins and managers: from overwhelmed by clean-up to assured of reliable data.		8.2 OFFLINE (8. CHANNELS of BEHAVIOUR) CH - Service desk stand-ups and huddles where data-quality issues are discussed. - Phone calls and walk-ups from callers, which agents then log as incidents. - Team-lead quality reviews and training or onboarding sessions. - Customer development: interview agents and managers about the fields they most often miss.
